# PRD — Smart Basket Meal Planner

Oct 17, 2026 · @Vanes, Lord Vanes

## Overview

Smart Basket lets a shopper choose what the family will eat this week and turns it into recipes and one shopping list made of the store's own products, added to the cart in one tap. Cookspace licenses it to a supermarket chain, starting with Unimart, as a white-label feature inside the chain's app and website.

**The problem for shoppers.** Planning a week of meals takes time. Most households in Dhaka shop from memory, forget items, make extra trips and waste food. Recipe apps don't connect to what the local store sells or what it costs.

**The problem for the retailer.** Online baskets are small and irregular. Shoppers buy a few items, then leave for a cheaper or quicker option. The retailer wants bigger baskets and a reason to come back every week.

**The pitch to the retailer:** more items per basket, a weekly repeat habit, and data on what families plan to cook. It is a sales tool for the store, not just a recipe app.

## Users and their jobs

| User | Who they are | What they need |
|---|---|---|
| Home cook | The person in the household who plans meals and shops, often a working parent | Decide the week's meals quickly, cook familiar Bangladeshi dishes, stay within a budget, buy everything in one go |
| Busy professional | Lives alone or as a couple, cooks a few times a week | Simple, fast recipes, small quantities, little waste |
| Health-focused family | Has diet goals such as low sugar or high protein | Meals that fit the goal without extra effort |
| Retailer (Unimart) | Category, e-commerce and marketing teams | Bigger baskets, repeat visits, promotion space, a shopper insight report |

## Goals and success metrics

**Business goal:** a signed paid pilot with one supermarket chain within three months of the first demo.

| Metric | Pilot target |
|---|---|
| Average items per basket from a meal plan | 50% higher than the store's average online basket |
| Shoppers who make a second weekly plan | 40% or more |
| Plans that go to checkout | 30% or more |
| Items swapped by the shopper before checkout | Under 20% (shows the list is accurate) |
| Time from opening the planner to a full cart | Under 3 minutes |

Agree with the retailer before launch which of their own numbers we compare against.

## Scope

**MVP, a branded demo in 4–6 weeks.** Enough to pitch and run a small pilot.

- Household setup: number of people, weekly budget in Tk, diet preferences
- A recipe library of about 150 everyday Bangladeshi dishes in Bangla and English, plus some popular Chinese, Thai and continental dishes
- Pick dishes for each day, or tap "Plan my week" for an AI suggestion
- Recipes scaled to the household size
- One combined shopping list, with quantities merged across recipes and pantry staples marked "you may have this"
- Every list item matched to a real store product with price and pack size
- Budget check: total cost shown live, with cheaper swaps offered when over budget
- "Add all to cart" into the retailer's cart
- Retailer dashboard: plans created, baskets, top dishes, top products

**Later.**

- Fridge or pantry photo to suggest dishes from what is already at home
- Voice step-by-step cooking mode in Bangla
- Health goals with nutrition per meal
- Leftover planning (tonight's chicken becomes tomorrow's biryani)

- Sponsored dishes and brand placements for suppliers
- Ramadan, Eid and festival menus
- Weekly reminder with last week's plan ready to repeat

## Key user flows

**First time: set up the household (under 1 minute)**

1. Opens "Meal Planner" in the retailer's app.
2. Picks household size, weekly food budget and any preferences (no beef, vegetarian days, low sugar, mild spice).
3. Lands on an empty week.

**Plan the week**

1. Taps "Plan my week" and gets 7 days of suggestions within the budget, or picks dishes one by one by searching or browsing.
2. Swaps any dish with one tap ("something else with fish").
3. Sees the week's total cost update as dishes change.

**From plan to cart**

1. Opens the shopping list: all ingredients combined, grouped by store aisle.
2. Unticks items already at home.
3. Sees each item as a store product with brand, pack size and price; can switch brand or pack.
4. Taps "Add all to cart" and finishes checkout in the retailer's normal flow.

**Cook**

1. On the day, opens the recipe: ingredients for the household size, steps in Bangla or English, cooking time.
2. Ticks steps as they go.

## Functional requirements

P0 = must have for the pitch demo and pilot, P1 = should have during the pilot, P2 = later.

| ID | Module | Requirement | Priority |
|---|---|---|---|
| B-01 | Setup | Household size (1–10), weekly food budget in Tk, diet preferences and dislikes; editable any time | P0 |

| ID | Module | Requirement | Priority |
|---|---|---|---|
| B-02 | Recipes | Library of about 150 dishes with Bangla and English names, photos, time, difficulty, spice level and tags (fish, vegetarian, breakfast, tiffin) | P0 |
| B-03 | Recipes | Quantities scale with household size; local units supported: g, kg, ml, litre, piece, hali (4 eggs), dozen, "1 cup", "1 tsp" | P0 |
| B-04 | Planner | Week view with breakfast, lunch and dinner slots; the household chooses which slots to plan | P0 |
| B-05 | Planner | "Plan my week" fills the chosen slots within budget and preferences, without repeating a main dish in 3 days | P0 |
| B-06 | Planner | Swap one dish, lock a dish, or ask in plain words ("two fish days, one easy day") | P1 |
| B-07 | List | Combine ingredients across all dishes into one list (3 recipes each needing onion = one onion line in kg) | P0 |
| B-08 | List | Pantry staples (salt, oil, turmeric, chilli powder) marked "you may have this" and unticked by default after the first week | P0 |
| B-09 | Matching | Each ingredient matched to a store product, choosing the pack size that covers the need with least waste | P0 |
| B-10 | Matching | Out-of-stock item replaced with the closest available product, clearly marked as a swap | P0 |
| B-11 | Budget | Live total in Tk; when over budget, offer cheaper brands, smaller packs or a cheaper dish | P0 |
| B-12 | Cart | "Add all to cart" sends every ticked item to the retailer's cart in one call | P0 |
| B-13 | Cooking | Step-by-step recipe view with timers; ingredient amounts shown inside each step | P1 |
| B-14 | Repeat | "Repeat last week" and a weekly reminder on the shopper's chosen day | P1 |
| B-15 | Photo | Photo of fridge or pantry suggests dishes that use what is there | P2 |

| ID | Module | Requirement | Priority |
|---|---|---|---|
| B-16 | Health | Nutrition per serving and plans for low sugar, high protein or weight goals | P2 |
| B-17 | Retailer | Dashboard: plans created, conversion to checkout, basket size, top dishes, top products, swaps | P0 |
| B-18 | Retailer | Featured dishes linked to promotions ("Hilsa week"), set by the retailer | P1 |

## AI features

The planning and matching logic should be mostly rules and data, with AI where it clearly helps. That keeps costs low and prices accurate.

| Feature | What the shopper sees | How it works | Guardrail |
|---|---|---|---|
| Plan my week | A full, varied week that fits the budget | Rules pick candidates from the library (budget, preferences, no repeats); an LLM picks a balanced week and writes a one-line reason per day | Prices always come from the store catalogue, never from the model |
| Plain-language requests | "Make Friday special" or "no oil-heavy food" changes the plan | LLM turns the request into filters and swaps on the library | Shows what it changed; one tap to undo |
| Ingredient-to-product matching | The right product at the right pack size | Embedding search between ingredient names and the store catalogue, with a manual mapping table for the top 300 ingredients | Low-confidence matches shown with "check this item" |
| Fridge photo (later) | "You have eggs, tomatoes and spinach: try these three dishes" | Vision model lists items in the photo; dishes ranked by how much they use | Shopper confirms the detected items |

| Feature | What the shopper sees | How it works | Guardrail |
|---|---|---|---|
| Cooking voice mode (later) | Bangla voice reads each step | Bangla text-to-speech on the recipe steps | Text always shown on screen |
| New recipes (later) | A larger library | LLM drafts recipes in a fixed format; a cook tests and approves each before it goes live | No unreviewed recipe goes live |

No AI-generated food photos presented as real dishes; use real photography or clearly styled illustrations.

## Retailer integration, data and quality

### Integration options, simplest first

| Option | How it works | Retailer effort | When to use |
|---|---|---|---|
| Hosted web module | Planner runs on our server, opened from a button or banner in the retailer's app and site, in its colours | Low: a link plus a product feed | Pitch demo and pilot |
| Embedded SDK | Planner screens built into the retailer's own app | Medium: their app team adds our package | After the pilot |
| API only | Retailer builds its own screens on our planning and matching API | High | Large chains with their own product team |

### What we need from the retailer

- Product catalogue feed: product ID, name in Bangla and English, brand, pack size and unit, price, category, image, stock status. Daily file at minimum, hourly for price and stock.
- An add-to-cart endpoint, or a link format that opens the cart with items pre-filled.
- Their brand guidelines.
- Agreement on who owns which data, in writing.

### Core data model

- **Recipe:** names, servings, steps, tags, time, photo, and a list of ingredients.
- **Ingredient:** canonical name ("onion"), Bangla name (পেঁয়াজ), quantity, unit, whether it is a staple.
- **Product match:** ingredient to one or more store products, with a conversion (1 hali = 4 eggs, 1 medium onion = about 100 g).
- **Plan:** household, week, slots, chosen recipes, list and cart status.

### Non-functional requirements

- A week's plan and list generated in under 5 seconds.
- Prices and stock never more than an hour old at checkout.
- Works on low-end Android phones and slow 3G or 4G.
- Bangla first, English second, with the same content in both.
- Shopper data used only for the shopper's own plans and the retailer's aggregate reports; no sale of personal data; account deletion on request.

## Pricing, milestones, pitch demo and open questions

### Business model to propose

- **Setup fee:** branding, catalogue integration and recipe-to-product mapping for that store.
- **Monthly licence:** covers hosting, recipe updates and the dashboard.
- **Performance share:** a small percentage of the value of baskets that come from a meal plan, so Cookspace earns more when the retailer does.
- **Later:** sponsored dishes and brand placements, shared with the retailer.

Set the actual numbers after a first conversation with the retailer about their online sales volume.

### Milestones

1. Week 1–2: clickable mock-up in Unimart's colours, 30 recipes, a sample product list.
2. Week 3–4: working planner, combined list and budget check on a sample catalogue of about 500 products.
3. Week 5–6: "Plan my week" AI, polished demo, pitch deck with the business case.
4. Pitch meeting with the retailer.
5. Pilot of 8–12 weeks: live catalogue feed, 150 recipes, cart hand-off, dashboard.

### The pitch demo, in 3 minutes

1. "A family of four, Tk 3,000 for the week, no beef."
2. Tap "Plan my week": seven days of familiar dishes appear, under budget.

3. Swap Wednesday for a fish dish; the total updates.
4. Open the list: 40 items combined, every one a real store product with price.
5. "Add all to cart": a full basket in under 3 minutes.
6. Close on the retailer dashboard and the basket-size comparison.

Build the demo on the retailer's real products where possible. Prices can come from their public website, refreshed before the meeting.

**Open questions**

- [ ] Who at Unimart owns e-commerce, and can we get a meeting?
- [x] ~~Does the retailer have a product feed or API today, or only a website?~~
- [ ] Who owns the recipe content we create for one retailer, and can we reuse it for another?
- [ ] Do we pitch other chains (Shwapno, Meena Bazar, Chaldal) at the same time, or offer the first retailer a short exclusivity?
- [ ] Who on the team tests and approves recipes?
